

(a) Build transferable experience

Past trajectories

other repositories

repo A	●-□-□-□- X - ⊗
repo B	●-□-□-□-□- X -✓
repo C	●-□-□- X -□-✓

task, actions, errors, outcome

Experience abstraction

drop repo-specific files,
names and environment; keep
what to do, avoid, and when

Transferable lesson

example

Strategy

Isolate the failure first

Warning

Avoid full setup before a repro

Condition

Setup is obscuring the failure

Experience graph

error patterns

setup failure

wrong output

shared rule

isolate failure first

strategies / warnings

strategy (repo A)

strategy (repo B)

source experiences

repo A failed ~~X~~

repo B solved ✓

link & merge

Agent selection

full context: search, read records, follow links; select useful lessons

task, code

strategies, warnings

failure, last action, hypothesis

recovery guidance

① Before planning

Current issue

task + code context

Plan

where to look first

Act

inspect, edit, test

Observe

tests, errors

② After an error

Revise

diagnosis, next step

(b) Repair in the current repository

--> query -> guidance -> action / observation

(c) After every task

Task ends

success or failure

Distill

strategies and warnings

Link into the graph

update retrieval entries

Next task

can select them
